This document will describe the structure and how the sidecars are actually used. The individual modules in an XMP sidecar do not have to follow this document. 1.1 File Structure XMP sidecar files have a very basic structure. They are always named by a string like "sidecar1.xmp" or "sidecar2.xmp", and are always located at the same folder and file location. A module can be anywhere from a few bytes to a few hundred KBs. A module is separated by a number of bytes called a "byte" (0x20). The "byte" counts are always multiples of 0x20, since the modules do not follow standard byte counts. The bytes are numbered by the example module, and modules start with the byte 0x0001. 1.2 Modules The individual modules are named based on the byte they have. They can be used to animate graphical elements that are embedded in the reactivemusicfile. What can the RML-Editor do? It can load RML-Modules with themes that have been stored in XML files. The editor provides a graphical user interface (GUI) for the selection and editing of elements which have been imported from a XML file. The XML file also contains information about certain functions of the element, such as: General element information, number of voices, number of times each channel is used and if it is a reserved word Voice specific information: Whether this voice is the root voice The number of notes in this voice How they are stored in the XML file The Pitch value of the root note The Channel that the voice is connected to If this is a string or a delay If this voice represents a looped note The duration of the voice When the voice starts to play Information about the speed of a normal value Whether the value should be shortened by zero points Volume Arpeggiator Sequencer Breath If it is the output of a channel The
